Some evident sources of complexity in nuclei

-There are many nuclei (>3000). Nuclear phenomena evolve along the nuclear chart. A unified description of all facets would be desirable.

-Ideally, one should get all phenomena from the bare interaction BUT nuclei are mesoscopic systems ($A \sim 1-500$) with bad numerical scaling.

-Each nucleus is a complex problem per se.

(Energy landscape of a molecule)

This motivates the search of disruptive techniques (high risk/high potential benefits)

An illustration with the nuclear Energy Density Functional theory

Machine learning: a different angle of attack

Progress of machine learning:

- Image classification:
cancer detection, particle detection
- Generative AI:
turbulence
- Inverse problems:
cosmology
- Many body problem:
spin systems, bosons

A review:

G. Carleo et. al., arXiv:1903.10563 (2019)

In nuclear theory:

- Machine learning for experimental nuclear masses or radii tables
- Acceleration of EDF calculations

⇒ A land of opportunities

Goals: ➡ Automate the “theoretical production” process
➡ Reduces “significantly” the numerical cost
➡ Teach artificial intelligence (AI) to predict nuclear physics

Some literature...

Neural networks, Bayesian Neural Net., Gaussian Processes were used to fit:

Nuclear masses

- Athanassopoulos *et. al.* NPA 743 (2004)
RMS = 950 keV
- Utama *et. al.* PRC 96 (2017)
- Utama *et. al.* PRC 97 (2018)
RMS decreased by 40%
- Zhang *et. al.* J Phys. G (2017)

Drip-lines

- Neufcourt *et. al.* PRC 98 (2018)
- Neufcourt *et. al.* PRL 122 (2019)
- Niu *et. al.* PLB 778 (2018)
Estimation of **uncertainties**

Neural networks used as a mean to IR extrapolate ($N_{oh} \rightarrow \infty$)

Nuclear radii

- Akkoyun *et. al.* J. Phys. G: NPP 40 (2013)
- Utama *et. al.* J. Phys. G: NPP 43 (2016)

Fission yields

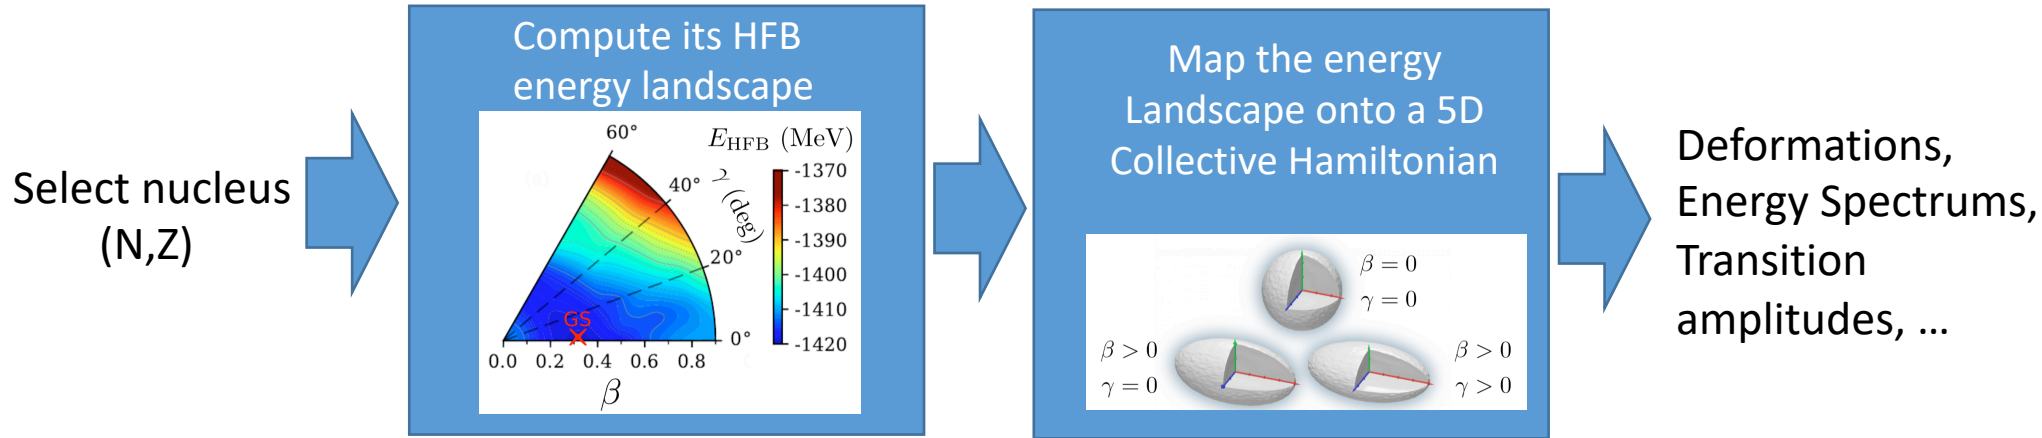

- Lovell *et. al.* EPJ Web of Conf.(2019)
- Wang *et. al.* PRL 123 (2019)

- Jiang *et. al.* PRC 100 (2019)
- Negoita *et. al.* PRC 99 (2019)

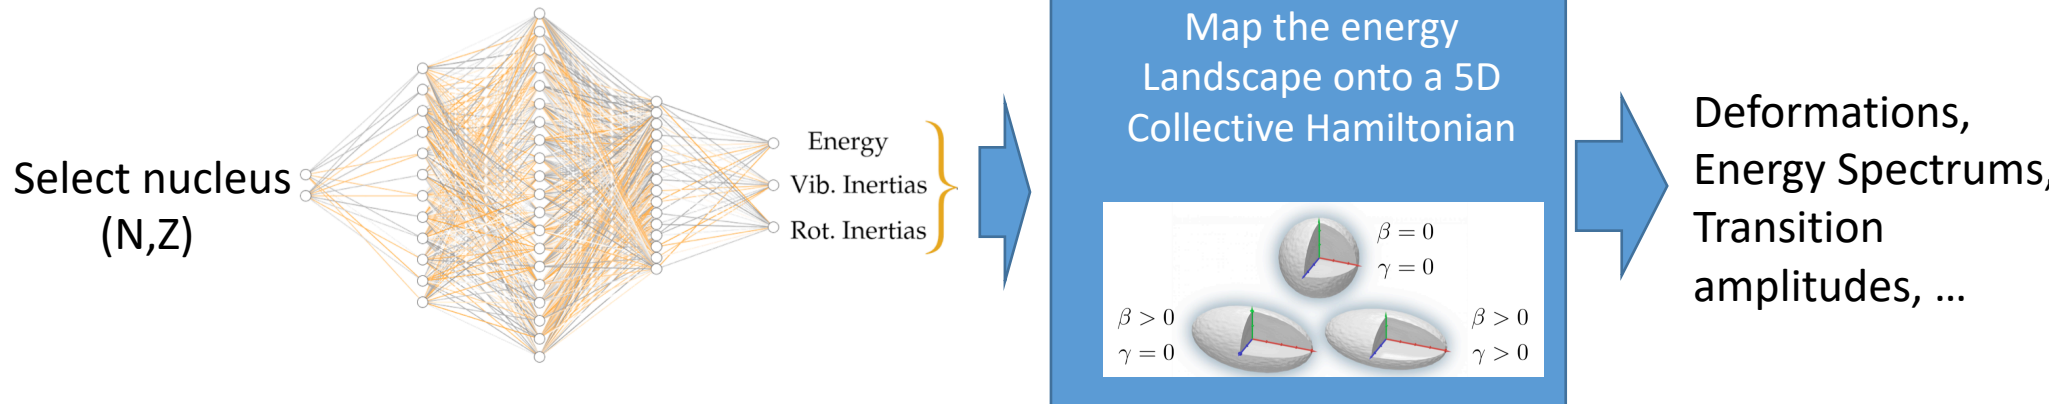

One recent illustration: prediction of masses, deformation and spectrum by neural network

Conventional strategy

Goal: replace the time-consuming part by a neural network

Network trained on a limited set of HFB datas

One recent illustration: prediction of masses, deformation and spectrum by neural network

Conventional strategy

Select nucleus
(N,Z)

Compute its HFB
energy landscape

$\beta > 0$
 $\gamma = 0$

Regnier, Lasserri, Ebran, Penon, [arXiv:1910.04132](https://arxiv.org/abs/1910.04132)

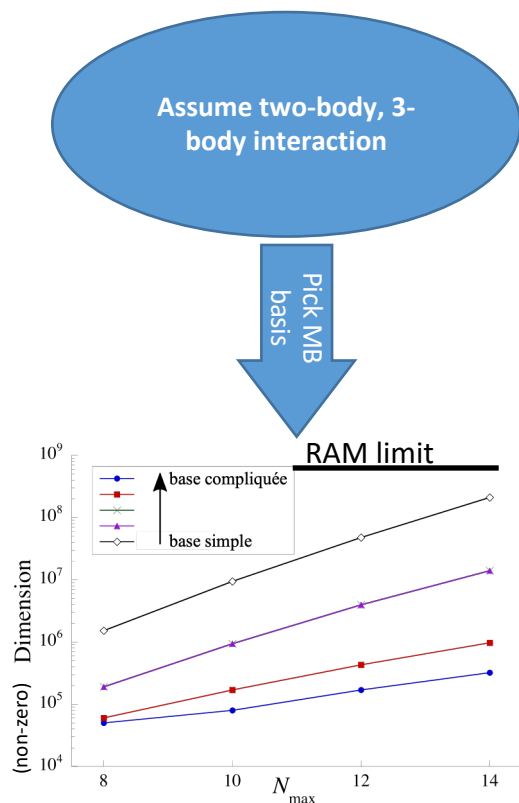

FIG. 2: (a) The AME2016 database nuclei are plotted in grey as a function of N and Z . The red squares stand for nuclei included in the 10% training set obtained by the active learning. The panels (b),(c) and (d) display the resulting RMS per nucleus ($\mathcal{L}_t^{1/2}(N, Z)$) for the three outputs E_{HFB} , I_2 and B_{00} respectively.

Another potential use of AI: learning how to select Many-body states

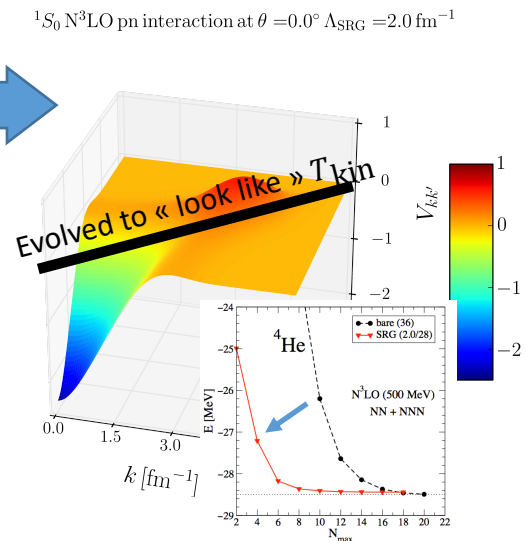

- High-dimensionality principal components analysis of Hamiltonian matrix

preconditioning

SRG

Evolved to « look like » Tkin

The goal is to overcome the limitation of our computing capabilities

Few ways can be followed:

- ✓ Neural Networks used as a standard tool for extrapolation of the MB basis
- Neural Network as a classifier for un-converged computation of resonances
- Many-body ansatz based on Neural Network for fermionic species (✓bosons)

technology from picture manipulation to tailor SRG generator or phase-equivalent transformations

- Reduce induced interactions
- Preconditioning of MB problem

Propagate to MB (e.g. like IM-SRG) or Hamiltonian matrix generation for CI method

Entering into the Quantum Computing age

Rigetti

IBM

Google

Limitations:

~ 50 qubits
~ 50 gates

Future:

~ 500 qubits
~ 500 gates

Example

RIGETTI superconducting 19 Qubit

IBM QX5 (16 qubits)

→ IBM Q Experience

A timely period

(from G. Hagen)

There is a lot of excitement in this field due to substantial progress

1. Quantum processing units now have ten(s) of qubits
2. Businesses are driving this: Google, IBM, Microsoft, Rigetti, D-Wave, ...
3. Software is publicly available (PyQuil, XACC, OpenQASM, OpenFermion)
4. First real-world problems solved: H₂ molecule on two qubits [O'Malley et al., Phys. Rev. X 6, 031007 (2016)]; BeH₂ on six qubits [Kalandar et al., Nature 549, 242 (2017)]; ...

Simulating physics with computers-1982

Richard P. Feynman (Nobel Prize in Physics 1965)

"Nature isn't classical, dammit, and if you want to make a simulation of nature, you'd better make it quantum mechanical, and by golly it's a wonderful problem, because it doesn't look so easy."

Where we are now ?

55
YEARS

18
YEARS

6
YEARS

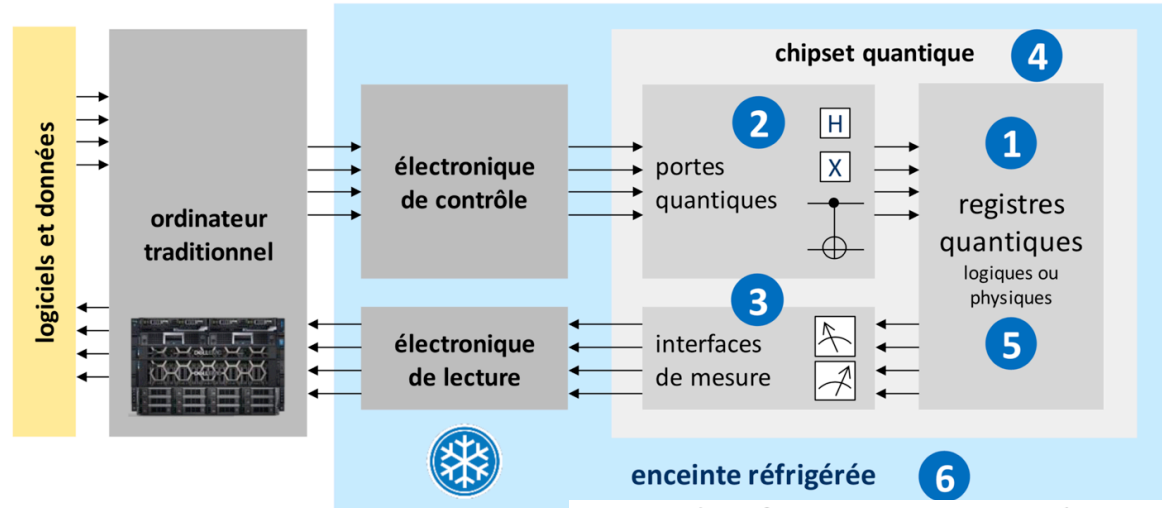

1
YEAR

We are at the NISQ (Noisy Intermediate-Scale Quantum) era. Quantum computers can be used but they are stable for very short time (noise, decoherence, ...). Only short QC circuits can be run.

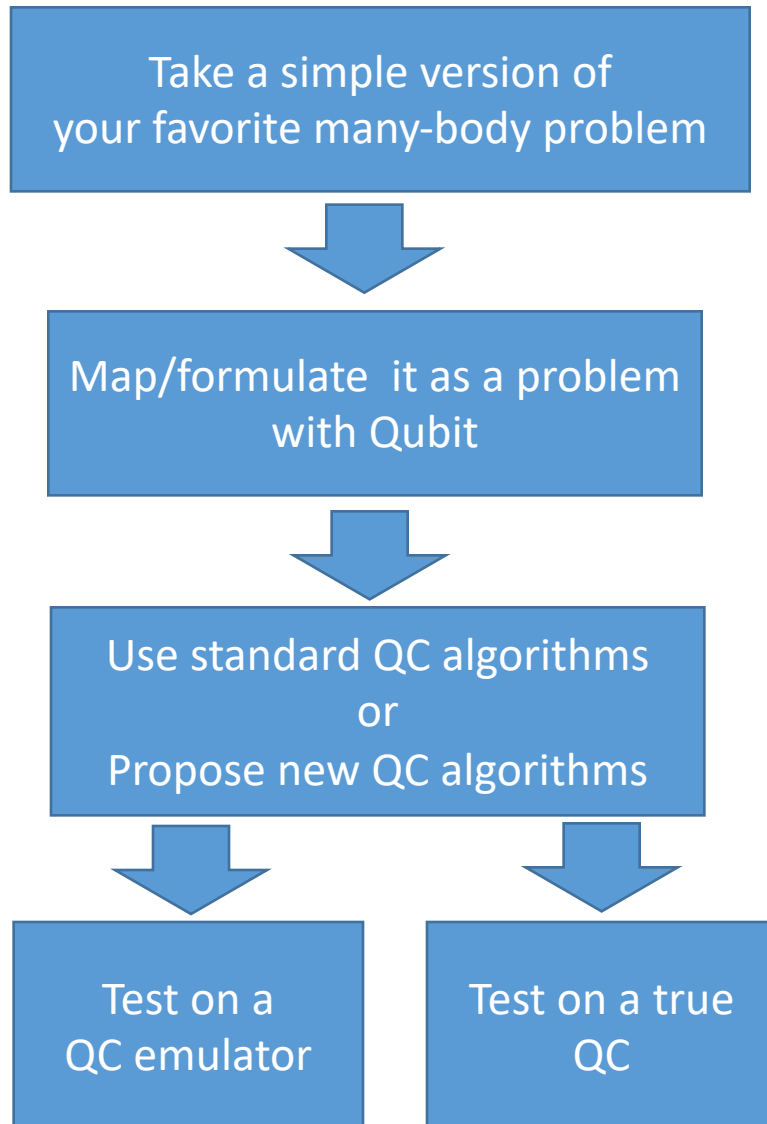

When is beyond the NISQ era?

International context

The QC/QIS scientific community

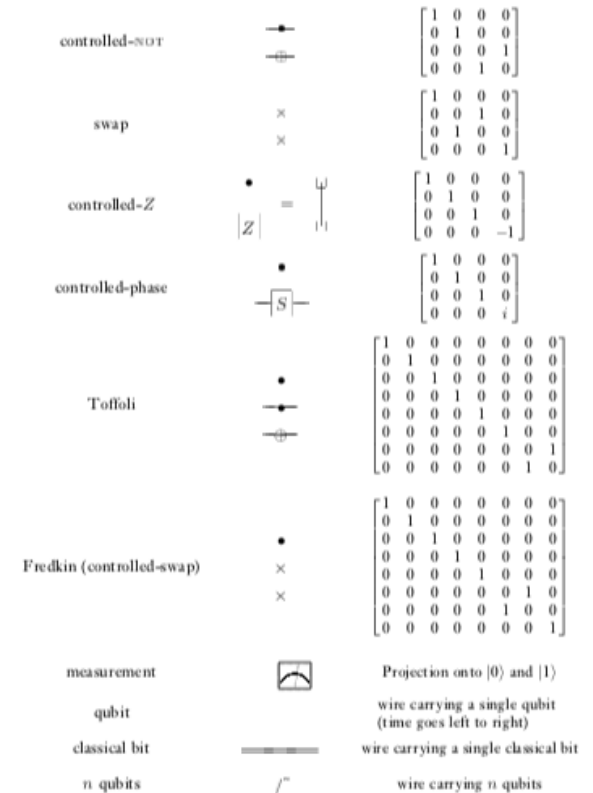

Strategy

Constraint: -Work with a restricted number of operation

Hadamard	\boxed{H}	$\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$
Pauli-X	\boxed{X}	$\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$
Pauli-Y	\boxed{Y}	$\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$
Pauli-Z	\boxed{Z}	$\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$
Phase	\boxed{S}	$\begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}$
$\pi/8$	\boxed{T}	$\begin{bmatrix} 1 & 0 \\ 0 & e^{i\pi/4} \end{bmatrix}$

- Design new algorithms adapted to the many-body problem
- Control the inherent quantum noise

Strategy

Cloud Quantum Computing of an Atomic Nucleus

E. F. Dumitrescu,¹ A. J. McCaskey,² G. Hagen,^{3,4} G. R. Jansen,^{5,3} T. D. Morris,^{4,3} T. Papenbrock,^{4,3,*}
R. C. Pooser,^{1,4} D. J. Dean,³ and P. Lougovski^{1,†}

Schematic deuteron Hamiltonian in Harmonic basis

$$H_N = \sum_{n,n'=0}^{N-1} \langle n' | (T + V) | n \rangle a_n^\dagger a_n.$$

$a_n^\dagger (a_n)$ create (annih.)
1 deuteron in $|n\rangle$

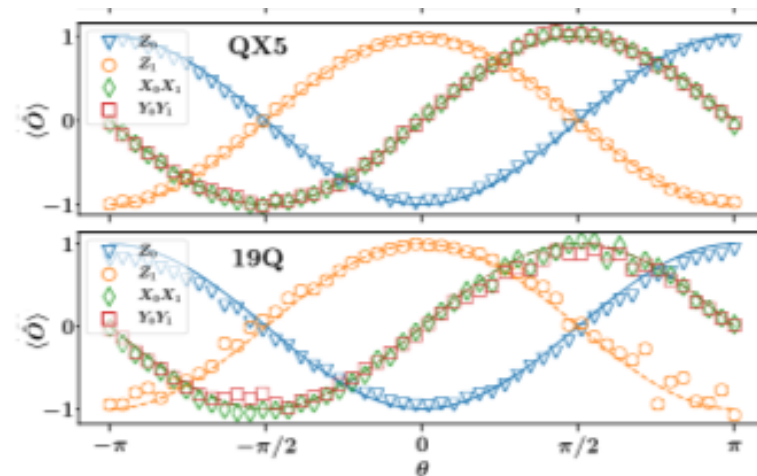

$n, n' = 0, 1, \dots, N-1$

Use Pauli matrices+Jordan-Wigner transformation

$$a_n^\dagger \rightarrow \frac{1}{2} \left[\prod_{j=0}^{n-1} -Z_j \right] (X_n - iY_n) \quad 0 (1) \text{ particles in } |n\rangle \rightarrow |\uparrow\rangle (|\downarrow\rangle)$$

➡ This automatically map the Hamiltonian as a function of Pauli Matrix

➡ Use the VQE quantum-classical algorithm with 10000 measurements on QX5 (19Q)

Take a simple version of
your favorite many-body problem

Map/formulate it as a problem
with Qubit

Use standard QC algorithms
or
Propose new QC algorithms

Test on a
QC emulator

Test on a true
QC

Strategy

σ Models on Quantum Computers

Andrei Alexandru,^{1,2,*} Paulo F. Bedaque,^{2,†} Henry Lamm^{2,‡} and Scott Lawrence^{2,§}

(NuQS Collaboration)

Start with the discretized σ model

$$\mathcal{H} = \sum_r \left(\frac{g^2}{2} \pi(r)^2 + \frac{1}{2g^2 \Delta x^2} [\mathbf{n}(r+1) - \mathbf{n}(r)]^2 \right)$$

Map it to a Spin algebra (fuzzy sphere)

$$-\frac{g^2}{2} \nabla^2 \psi \rightarrow H^0 \Psi = \kappa \frac{g^2}{2} \sum_{k=1}^3 [\mathbb{J}_k, [\mathbb{J}_k, \Psi]],$$

\mathbb{J}_k are generators of the SU(2) algebra

“only” $j=1/2$ was considered

$$j_1 = \mathbb{1} \otimes \sigma_2 / \sqrt{3}, \quad j_2 = \sigma_2 \otimes \sigma_3 / \sqrt{3}, \quad j_3 = \sigma_2 \otimes \sigma_1 / \sqrt{3},$$

This gives the link with Pauli matrices

→ Use the Suzuki + specific QC

GAUGE THEORIES FOR QUANTUM COMPUTING

Very limited studies exist, e.g.:

- 1+1 D QED (Schwinger model) on a few-qubit trapped-ion quantum computer [E. A. Martinez et al., Nature 534 (2016) 516, arXiv:1605.04570]
- Quantum-Classical calculation of Schwinger Model [N. Kico et al., Phys. Rev. A 98 (2018) 032331, arXiv:1803.03326]
- U(1) lattice gauge theory without matter in 2 & 3 spatial dimensions [D. Kaplan, J. Stryker, arXiv:1806.08797]
- Zeta-regularized vacuum expectation values [T. Hartung, K. Jansen, arXiv:1808.06784]
- O(3) nonlinear sigma model in 1+1 dimensions [F. Bruckmann, K. Jansen, S. Kuhn, arXiv:1812.00944]

Extending the studies to 2+1 dimensions is extremely hard and has not been established yet on quantum devices
